Although the three applications were similar in that they were all vector-based applications, they also had significant differences in the way they were organized, used different file formats, and had different interfaces. Many of AutoCAD's features were copied from other CAD programs. For example, it added features from DWG Viewer in 1985. AutoCAD was also released in 1991 to run on the first generation of Windows PCs that had 64 MB of RAM and a 4 MB video adapter. By that time, 2-D CAD tools were already available on personal computers. These included CorelDRAW and VectorWorks. AutoCAD's unique selling proposition was that it was the first true CAD tool on a personal computer, but this came at the expense of many of its features. Although PC-based CAD tools were slow and difficult to use and required an operating system and graphics driver to render graphics, users appreciated the ease of use and reduced graphics problems that CAD application had compared to early CAD systems on mainframe and minicomputers. In contrast, mainframe CAD systems required a lot of training and were quite expensive to purchase and operate. The movement from pen and paper to CAD was driven in large part by a 1990 United States Bureau of Labor Statistics report that noted that there had been a decline in the number of drafting and design jobs as a result of the computer age. In May 1991, the United States Bureau of Labor Statistics predicted that by the year 2000 there would be a 15% decrease in the demand for CAD professionals. History AutoCAD was developed at AutoDesk (renamed from Autodesk in 2004) by an early team of three people – Ken Cooper, Alan Hall and Bob Swartout – in response to a shortage of skilled CAD operators. The development team set out to create a completely new CAD application that
