
Software Wago I O Check 3 15

Based on the many years of experience with automatic parameter control, including telecom, waterworks and local building automation, WAGO has developed its own control software, the WAGO Global Client. Its software and the WAGO service technology allow end users to control tens of thousands of devices including control panels and sensing systems, from all over the world. For more information, please refer to the www.wago-global.com. WAGO supports distributed control according to the principle of a distributed system. The advantages include the possibility of using the device over a LAN, remotely managing the device and to extend the network. By using TCP/IP, the device can even be controlled from a completely different continent. WAGO offers a wide range of connectivity options for professional networking and data exchange. They consist of an Ethernet cable, a Modbus/TCP link, and one of the many wireless communication options. A WAGO device can be operated as an internet, web, or mobile device. with the wago i/o-check, the wago-plc is available in an all-in-one solution for real-time monitoring and analysis of your production process. the wago i/o-check offers 24/7 monitoring. the multi-level alarm functions, the status display and the operating range are clearly presented in a user-friendly manner. the system can be used to control, monitor and analyze industrial processes and machines. the combination of wago-plc and wago i/o-pro offers great flexibility when it comes to configuration. the wago i/o-pro is able to control multiple connected wago-plc units in parallel, while also offering redundancy when there is a breakdown.

Software Wago I O Check 3 15

WAGO Plug-In LMS is one of the first applications to use this technology. In addition to the previously available LMS solution, it adds a new WAGO Connect module, which complements the classic IO Check system. It is a unit that installs on a WAGO IO Check system, where it is connected via LAN or serial port to a WAGO Cloud Module. The module is assigned a special address for a WAGO Connect unit on a TCP connection. Suddenly the ECU message, with the signal, is recognised, but at the same time too much time is allowed for the response of the EAP, so the response can only be realised by the transmission of the ECU code (E-code). This does not cause a reaction of the Wago IO Check system on the LAN. But the IO Check system sends a reply to the EAP through the serial port of the Wago Cloud module. Now everything is switched on and the ECU can act as a gateway to the Wago IO Check system. Now the machine sets another value and Wago is again operating in the PLC in the original view. After switching off the machine, the value is stored into the memory of the Wago Cloud module. The value of TIA Portal is set from here on. The service, which is available for free, can be used either as a service in the device itself or as a component of a cloud solution. WAGO Cloud Individual is an interoperable cloud solution for industrial IoT. It works as an extended IO Check System (e. g. by using a Wago IO Check module). Because the cloud has the same server architecture and is based on OpenStack, it is possible to use existing cloud management solutions, such as Kubernetes or Docker, with little effort. Consequently, WAGO Cloud Services is a modular and scalable cloud management and monitoring solution that allows for the creation of multiple cloud services, from basic cloud service components (e. g. an OpenStack disk, DNS or an IP address) to complex cloud services, which are provided as OpenStack templates. 5ec8ef588b
