Photoshop has come a long way since the very beginning. The flagship program now supports many functions not implemented in Elements, including layer masks, channeled fixes and layers, colour adjustment tools such as Curve, Levels and Curves and more. This makes it easier to edit the colour and light values of your image than with Elements, but means you can't do everything with it. On the flip side, however, you can apply so much more in one click in Photoshop than you can in Elements. You can access the new AI features in Photoshop by simply changing the AI tab in Filter Drawer's dropdown menu. If you are unfamiliar with it, click the CS6 drop down menu and choose Adobe Photoshop Camera Raw. This will bring up the Camera Raw workflow and new tab that contains the AI module. You can access new features by clicking on the AI tab within the dropdown menu above. From within this tab, you can also access the suite of new Creative Cloud features. This includes integrating your Lightroom photo library for seamless integration. Integration of your canvas can also be done by selecting your Photoshop canvas, and then choosing the canvas tab. The AI module is where it gets really good, and you can access these new features by selecting "Adobe Sensei" in the filters dropdown menu. This brings up a wizard that allows you to create facial recognition filters, lens correction filters, HDR lighting and other effects. You can even design and create custom styles and brushes. Creative Cloud also brings up new custom options in the panels. The usability of the filters is really powerful within Photoshop, and on top of that Photoshop comes with a lot of new features, including in-depth adjustments and always-updated hardware and software compatibility.

Photoshop has always been a server-side application (requiring an internet connection) until now. That's changing with Share for Review. Now you can review work you've created in Photoshop without leaving a web browser -- simply send yourself a link to the image, or send it via email or even the post office. If you're using IntelR Virtual Image Editor, you can also create a fully functional website within Photoshop for users to save and share. One of the most exciting additions for the year ahead is the desktop app for Photoshop. It enables actions from the desktop version of Photoshop, integrated into the app itself, including the new one-click Delete and Fill tool. This command replaces several tools (Auto Mask, Gradient Merge and Replace Color) and removes the need to select objects in a group and use the Delete command. You can see the full suite of actions that Photoshop now has to offer here:

<http://www.adobe.com/go/photoshop-actions> Photoshop Elements for the first time enables applications that make integrating images from the browser even easier, without Photoshop The new integration supports all browsers including Google Chrome, Firefox and Safari, the only app that currently supports the full feature set for this functionality. And of course, image-heavy website pages maintain the appearance of their source design. One of the most powerful enhancements in Photoshop is the new Selection tool. It enables users to take the most efficient and productive

approach to making selections. Whether its selecting an object or an area, the new Selection tool reduces the steps of selecting multiple objects or bounded areas into a single action. This feature can be accessed through the Filters panel, File > Open > Open Workspace.

You can use the new Filter > Cloud Paint to let you create brushes and patterns using text and images from the web. The new features added in the update include Adobe X-Ray for inspecting 3D objects viewed on a web browser in real time, and a new AI-powered Lens Correction tool to remove wrinkles and other artifacts from photographs. If you're a Lightroom user, then top news is the announcement of a new update to Lightroom that brings support for new features, such as AI-powered Lens Correction. A host of new capabilities cut across creative, image, video, text, and time-based assets. Photoshop has also got some updates, in-line with its movement to more support for real-time creativity, and increased AI capabilities. To make the filter effects more real-time, Adobe has released some new features at the Adobe Max conference in Vegas. These features include a new filter: Neural Dust; spell-check on layers and vectors; and a new video editing tool, Creative Style Match. In 2023, Photoshop is going to roll out AI-powered tools to go even further towards real-time AI capabilities. Most recently, Adobe added DeepDream, a new tool that lets you use photos like a movie. For the first time, Adobe's Photoshop Lightroom has been updated with YouTube Lens, allowing you to view videos from YouTube via lenses from different devices. A new feature is Rebot - a new AI-powered extraction and segmentation tool that can recognize skin details so that edits can be applied to just that area. There are other new features too, such as a new paint bucket tool, a new video lens, a ton of new document-creation tools and more.
